patent No. 6794490

GENERAL INFORMATION:
APPLICANT: Cubist Pharmaceuticals, Inc.
TITLE OF INVENTION: NOVEL LIPOPEPTIDES AS ANTIBACTERIAL AGENTS
FILE REPREBACE: C060

CURRENT FILING DATE: 2000-12-15

NUMBER OF SEQ ID NOS: 1

SEQ ID NO 1

LENGTH: 38
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Inhibition of leukocyte super:oxide anion prodn. and attraction of leukocytes – using peptide(s) partic. based on antimicrobial PR-39.

Claim 12; Page 28; 45pp; English.

AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-) production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte 02-

production. The peptides can be used as medicaments for fighting hifection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of inhibiting leukocyte superoxide anion (O2-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or an eneutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S

AAR99116-R99123 are antimicrobial, magainin-analogue peptides that may be used to treat sexually transmitted diseases (STDS) caused by Chlamydia, HIV, herpese simplex virus, Neisseria gonnorhoeae or Candida infection. The peptides inhibit STDS by either killing the infectious organism, impeding the infection mechanism or interrupting the replication cycle of the organism. Squalamine (an aminosterol host defence molecule of the dog fish shark Squalus acanthias) and PGLa (a frog antimicrobial peptide) analogues may also be useful in inhibiting STD infection and transmission
                                                                                                                                                                                                                                                                                                                                                     Inhibiting sexually transmitted disease e.g. HIV or herpes simplex - by administering magainin antimicrobial or squalamine cpd. to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synducin; induction; expression; syndecan-1; syndecan-4; surface; mesenchymal cell; fibroblast; epithelial; Rr-39; treatment; stasis; decubitus; ulcers; keloids; skin burns; ischemic tisques; hypercoagulation states; prevention; tumour metastesis; restenosis; inhibition; angiogenesis; proliferation; endothelial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This peptide was isolated from the small intestine of a pig. The small inestine is an important endocrine organ and many physiologically active peptides have been isolated from it. This peptide inhibits the growth of, and may kill, bacteria, pref. gram negative bacteria. This peptide or its thnctional derivatives may be used in human or veterinary medicine for therapeutic or prophylactic use. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                 syndecan-1 and syndecan-4 on the surface of mesenchymal cells, esp.

fibroblasts and epithelial cells. The 36 N-terminal amino acids of the
peptide were found to be identical to the 36 N-terminal amino acids of PR
-39, a Pro and Arg rich antibacterial peptide previously found in porcine
intestine (W0922578). Synducins may be used in the treatment of stasis
and decubitus ulcers, keloids, skin burns, ischemic fissues and
hypercoagulation states, prevention of tumour metastasis, restenosis
inhibition and endothelial cell angiogenesis and proliferation induction.
expression following exposure to 5 % wound fluid, dbcAmP (1 mM), the
present peptide (10 microM) or a blank, to give respective cell surface
syndecan-4 values (moD/m in) of approx. 1.75, 1.70, 1.80 and 0.95
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; DNA synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; superoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.
                                                                                                Modulating mesenchymal interaction by administration of synducin - used in the treatment of wounds, tumours, restenosis, etc.

This sequence represents the proline-arginine rich antimicrobial peptide PR39 requence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. This sequence, and the fragments of it shown in AAW0147-W01454, can be used in the method of the invention. The method of the invention. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte a peptide such as this sequence) capable of inhibiting leukocyte 02- production. The peptides can be used as medicaments for fighting infection by the peptides can be used as medicaments for fighting infection by the second of the inventing tissue damage at the contracting leukocytes to a wound site and restricting tissue damage at the contraction of the contracting tissue damage at the contraction of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 administration into a mammal's bloodstream reduce reperfusion injury production of reactive oxygen species, neutrophila adherence to reduchelium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXP, where P is a requirement end X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reduction of reperfusion injury in temporarily occluded blood vessels - by administration of a peptide which is rich in proline or arginine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAW75722-W75732 are proline/arginine rich peptides that upon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           eukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

```
ideally contain 4 or 6 of these motifs, and that a peptide should ideally contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the neutrophil superoxide anion, and also the inhibition of neutrophil superoxide anion, and also the inhibition of neutrophil oxidase to some extent. All of the peptides also inhibited NADPH oxidase to some extent. All of the peptides also inhibit neutrophil oxidase activity. PR-39 is believed, to be the most potent endogenous produced, it can be suggested to be involved in eliminating or reducing the reperfusion injury induced adhesion and extraction of neutrophils.
                                                                                                                                                       The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery
                                                                                                                                                                                                                                                       Gaps

Peptides AAB97277 - AAB97279 represent PR-39 derived oligopeptides. PR-39

C is a member of the the cathelin family of proteins, mature PR-39

C represented by the present sequence is 39 amino acids in length, and has been shown to play a role in several inflammatory events including wound consider the protein of proteasone mediated in consequence is allowed family of oligopeptides cause selective inhibition of proteasone mediated introduction to a target cell. PR-39 derived peptides are intracellular introduction to a target cell. PR-39 derived peptides are been to interact with at least the alpha? subunit of the proteasomes, and therefore alter the proteolytic activity of proteasomes such that contracts methods for the selective inhibition of proteasome mediated contraction of proteasome mediated includes methods for the selective inhibition of proteasome mediated contraction in proteolytic activity of proteins occurs. The invention contraction of proteasome mediated contraction in angiogenesis as required in living tissues and organs which have suffered angiogenesis as required in living tissues and organs which have suffered myocardial is schemal of heart tissues. Examples are the myocardian, skeletal or smooth muscle, artery or vein, lung, brain, the contraction or extremities. A particular example is after myocardial infarction or extremities. ö Gaps ö 100.0%; Score 92; DB 4; Length 39; 100.0%; Pred. No. 0.00044; 0; Indels 0; Mismatches Query Match (100. This invention relates to a method for the stimulation of angiogenesis in situ within a targeted collection of viable cells. The method comprises introducing, into the cytoplasm, at least i member of the PR-39 oligopeptide collective, which interacts with cytoplasmic proteasomes. Part of the proteolytic activity of the proteosomes is selectively altered so as to stimulate angiogenesis. The method is used to induce angiogenesis in tissue that has suffered anoxia or infarction, e.g. myocardial infarction or chronic myocardial ischaemia, and also to study the mechanisms that control angiogenesis. The present sequence represents the PR-39 peptide from which peptide used in the method of the invention

Sequence 39 AA;

Stimulating angiogenesis in situ, useful e.g. for treating anoxia and infarction, by administering a PR-39 oligopeptide that regulates enzymatic activity of proteosomes.

The invention relates to a novel ophthalmic solution comprising a prostaglandin of the F-series and an antimicrobial peptide. A solution of the invention has hypotensive and ophthalmological activity. The solution is useful for the treatment of increased intraccular pressure, such as caused by glaucoma and for the reduction of ocular hypertension. The prostaglandin and the antimicrobial peptide work symergistically, to provide beneficial reduction in the incidence of irritant and toxic side effects such as hyperaemia, irritation and inflammation of conjunctiva, ocular cell dysplasia, iridial melanocyte hyperplasia, and hyperpigmentation, associated with the prior art prostaglandin compositions. The present sequence represents an antimicrobial peptide of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a PR-39 protein. The specification describes PR-39 derived peptides, which are used for selective inhibition of IxappaBalpha degradation within a targeted cell collection in-situ. The method is useful for selectively inhibiting IkappaBalpha protein degradation in situ, decreasing the activity of NFkappaB transcription factor and selective control of NFkappaB dependent gene expression in situ. The PR-39 derived peptides are useful in the treatment of myocardial infarction, chronic myocardial ischemia of heart disease and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method of inhibiting leukocytes superoxide anion (02-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for a trracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                           Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs to

The invention relates to inhibiting leucocyte superoxide anion (02-)

production using a naturally occurring proline-arginine (PR)-rich

artimicrobial peptide known as PR-39 and its truncated analogs. The

method comprises contacting leucocytes with the peptide comprising 39 or

method comprises contacting leucocytes with the peptide inhibits the activity

compression and anion production. The peptide inhibits the activity

of NADPH oxidase responsible for anion production, by binding to Src

compression of p47phox, which is a 47 kba cytosolic protein

compression of the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or

portine leucocyte and the mammalian leucocyte is neutrophil. Another

comprise also disclosed which employs a PR-39 analog that comprise 16

method is also disclosed which employs a PR-39 analog that comprise 16

comprise and the sum of the proline and arginine residues in the

effective peptide is at least 6 or 74 % of the total number of amino

completed are least 6 or 17 % of the total number of amino

completed are arginine residues. The method of the invention is useful

completed are arginine residues. The method of the invention is useful

completed are arginine residues. The method of the invention is useful

completed are arginine residues. The method of the provention is useful

completed are arginine residues and arginine and arginine and arginine are

completed are arginine residues. The method of the provention is useful

```
The invention relates to a vaccine comprising at least one antigen and at least one cathelicidin derived antimicrobial peptide or its derivative. The vaccine is useful for active immunization, especially of humans or animals without protection against the specific antigen. The cathelicidin derived antimicrobial peptide is useful in the preparation of an adjuvant for enhancing the immune response to at least one antigen, where the adjuvant enhances the uptake of at least one antigen in antigen presenting cells (APC), and the adjuvant is added to the vaccine. Sequences ABB07708-15 represent C-terminal fragments of antimicrobial peptides of the cathelicicidin family
                                                                                                                                                                                                                                                                         Vaccine for active immunization or for preparing an adjuvant for enhancing an immune response to at least one antigen, comprises at least one antigen and at least one cathelicidin derived antimicrobial peptide.
                                                                                                                                                                                         Fritz J, Mattner F, Zauner W, Buschle M, Egyed A;

          the small intestine.";
J. Leukoc. Biol. 56:807-811(1994).
-!-FUNCITON: Exerts a potent antimicrobial activity against both E.coli and B.megaterium.
-!- TISSUE SPECIFICITY: Small intestine and bone marrow.
-!- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                               By similarity.

Name=4; Synonyms=Kidney-specific, Kinase-defective;
Isola-0944A3-4; Sequence=VSP 050634, VSP 050637;
TISSUE SPECIFICITY: Widely expressed, with highest levels observed in the testis, heart, kidney and skeletal muscle.
DISEASE: Defects in PRKWNK1 are a cause of pseudohypoaldosteronism type II (PHAII) [MIM:145260]. PHAII is an autosomal dominant. disease characterized by severe hyportension, hyperkalemia, and sensitivity to thiazide diuretics which may result from a chloride shunt in the renal distal nephron.
SIMILARITY: Belongs to the Ser/Thr protein kinase family. WNK õ -!- CAUTION: Cys-250 is present instead of the conserved Lys which is expected to be an active site residue. Lys-233 appears to fulfill Event=Alternative promoter; Comment=2 isoforms, 1 (shown here) and 4, are produced by use GO; GO:0005737; C:cytoplasm; IDA.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Inhibition of leukocyte super:oxide anion prodn. and attraction of leukocytes - using peptide(s) partic. based on antimicrobial PR-39,

Claim 12; Page 28; 45pp; English.

AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-) production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte 02-

```
definition into a mammal's bloodstream reduce reperfusion injury administration into a mammal's bloodstream reduce reperfusion injury (production of reactive oxygen species, neutrophil adherence to endothelium, and extravasation of neutrophils). These peptides have two endothelium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXP, where P is a proline residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was catablished by structural and function analysis that a peptide should cleanly contain 4 or 6 of these motifs, and that inhibition. It was established with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the cutrophil superoxide anion, and also the inhibition of neutrophil chemotaxis. From this, it was found that all of the peptides inhibited NADPH oxidase to some extent. All of the peptides also inhibit neutrophil convinces and the supersected of the most potent endogenous down regulator of NADPH oxidase yet discovered, and from the data produced, it can be suggested to be involved in eliminating or reducing the reperfusion injury induced adhesion and extraction of neutrophils.
production. The peptides can be used as medicaments for fighting infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide; neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of inhibiting leukocytes superoxide anion (O2-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
The peptides are also useful in connection with surgical procedures such as coronary bypass and organ transplantation surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ů
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs

The invention relates to inhibiting leucocyte superoxide anion (02-) production using a naturally occurring proline-arginine (PR)-rich antimicrobial peptide known as PR-39 and its truncated analogs. The activation of the peptide comprising 39 or 26 amino acids, for a time and under conditions effective to inhibit to 126 amino acids, for a time and under conditions effective to inhibit conditions effective to inhibit conditions of the peptide inhibits the activity of Nubbh oxidase responsible for anion production, by binding to Src composite leucocyte and the mammalian leucocyte is a mammalian or conditions, where the sum of the proline and arginine residues in the proposition proline and arginine residues in the condition proline in the peptide is at least 6 or 74 % of the total number of amino acids, where the sum of the proline and arginine residues in the condition of pathphox in whole cells, therefore interfering with the binding condition and arginine residues in the peptide are arginine residues. The method of the invention is useful condition and arginine residues in the peptide are arginine residues. The method of the invention is useful condition and arginine residues in the condition and arginine residues are arginine residues. The method of the invention is useful a wound site, yet restrict tissue damage at the wound site caused by excessive oxygen radicals produced by these leucocytes. The present condition is PR-39 analog, PR-14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibiting leukocyte oxygen radical production comprises contacting a leukocyte with a peptide, where the inhibition occurs as a consequence of binding between the peptide and p47phox.
                                                                                                                                                                   Leucocyte; superoxide anion; oxygen radical; proline-arginine; antimicrobial; antioxidant; NADPH oxidase; p47phox; neutrophil; infection; wound; tissue damage; PR-39 analog; PR-14.

This invention relates to a method for the stimulation of angiogenesis in situ within a targeted collection of viable cells. The method comprises introducing, into the cytoplasm, at least 1 member of the PR-39 oligopeptide collective, which interacts with cytoplasmic proteasomes. Part of the proteolytic activity of the proteosomes is selectively altered so as to stimulate angiogenesis. The method is used to induce angiogenesis in tissue that has suffered anoxia or infarction, e.g. myocardial infarction or chronic myocardial ischaemia, and also to study the mechanisms that control angiogenesis. The present sequence represents a PR-39 derived peptide which interacts with the proteasome and can be used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                  Stimulating angiogenesis in situ, useful e.g. for treating anoxia and infarction, by administering a PR-39 oligopeptide that regulates enzymatic activity of proteosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PR-39; cathelin; inflammation; wound healing; myocardial infarction; proteasome; proteolysis; alpha7; peptide degradation; anglogenesis; anoxia; chronic myocardial ischaemia; heart tissue.

                                                                                                                                                                                                                                                                        Peptides AAB97277 - AAB97279 represent PR-39 derived oligopeptides. PR-39 is a member of the the cathelin family of proteins, mature PR-39 is 39 anino acids in length (see AAB97280), and has been shown to play a role in several inflammatory events including wound healing and myocardial infarction. The PR-39 derived family of oligopeptides cause selective inhibition of proteasome mediated degeneration of peptides and stimulation of angiogenesis after their intraccilular introduction to a target cell. PR-39 derived peptides are able to interact with at least the alpha7 subunit of the proteasomes, and therefore alter the corresponding control of proteasomes such that a selective increased expression of specific proteins occurs. The invention includes methods for the selective inhibition of proteasome mediated peptide degradation. The method provides means for stimulating angiogenesis as required in living tissues and organs which have suffered defects or have undergone anoxia and/or infarction, myocardial infarction or chronic myocardial senoth muscle, artery or vein, lung, brain, kindry, spleen, liver, gastrointestinal or nerve tissues, limbs, and extremities. A particular example is after myocardial infarction or ischaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                        Stimulation of angiogenesis and inhibition of proteasome mediated degradation in cells, by introduction of PR-39 oligopeptide or its N-terminal fragments or their conjugates, for use in anoxia and infarction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

It is used for selective inhibition of IkappaBalpha degradation within a targeted cell collection in-situ. The method is useful for selectively inhibiting IkappaBalpha protein degradation in situ, decreasing the activity of NFAappaB transcription factor and selective control of NFAappaB-dependent gene expression in situ. The PR-39 derived peptides are useful in the treatment of myocardial infarction, chronic myocardial ischemia of heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; DNA synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; supercoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.

isolated from porcine small intestine, and has also been identified in human and porcine small intestine, and has also been identified in human and porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 Kills bacteria by interfering with DNA and/or protein synthesis. PR39 also induces syndecan expression on mesenchymal cells. Syndecans are important in wound repair, showing that PR39 can be used in wound repair, as well as in antibacterial agents. These sequences, and PR39, can be used in the method of the invention is for inhibiting leukcoyte superoxide anion (O2-) production. The method comprises administering to a leukcyte a peptide (such as this sequence) capable of inhibiting leukcoyte a production. The peptides can be used as medicaments for fighting infection by attracting leukcoytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by the stating and also be used to develop products for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method of inhibiting leukocyte superoxide anion (O2-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Leukocyte superoxide anion; leukocyte O2- production;
